
=> Spring/Spring boot frameworks are given as the collection of modules (Ormmodules)
=> In the development of spring/spring boot Projects we can use only those modules which are really required.. This helps to reduce the size the projects.
=> For every module spring/spring boot seperate apis/libraries are given in the form of jar files .So we need to add only those jar files to the Project that are required as part of Project Architecture)

=> modules are core, aop (aspect oriented programming), data jpa, data mongo DB, mvc, security, cloud modules and etc.

=> For the all modules of the spring/spring boot the core module is base module (Every module is built on top of Core module)

=>If any module is used in spring style then it is called spring module eg: spring core ,spring mvc ,spring data jpa and etc.
=>If any module is used in spring boot style then it is called spring boot module eg: spring boot core ,spring boot mvc ,spring boot data jpa and etc..

Course Plan
==========

=>Introduction about languages , Technologies and Frameworks (Different categories of java programming)

=> Container Vs Server (For automating the execution of the comps)

=> Spring Core (Basics of spring programming)

=> Spring boot core (Basics of Spring boot Programming)

=> Spring boot data jpa (For interacting with SQL DB s/w like Oracle,mysql and etc..)

=> spring boot data mongoDB (For interacting with MongoDB Db s/w which is NOSQL Db s/w)

=> spring boot scheduling (To run the jobs/tasks by enabling scheduling)

=> spring boot mailing (To performing mailing operations from the Spring boot Projects)

=> spring boot MVC (To develop web applications/websites using spring boot)

=> spring boot Rest (MVC+rest) To develop Distributed Apps using spring boot)

.

.

.

more to come

=>In Core java , we study the syntaxes(rules) and semantics(structure) of the java programming

=>In spring core module , we study the syntaxes(rules) and semantics(structure) of the spring programming

=>In spring boot core module , we study the syntaxes(rules) and semantics(structure) of the spring boot programming

=> If app data is having fixed structure(schema)/attributes and also deals formatted data then prefer working with RDBMS s/w like Oracle ,MySQL and etc..
eg: registering employee having max 30 details

=> If App data is having dynamically growing structure (schema/attributes and also deals with unformatted data then prefer working with NOSQL DB s/w
eg): mongoDB , cassandra , neo4j and etc.

=> To store product details of e-commerce app then prefer working with NOSQL DB s/w

=>Scheduling the job /task is nothing but executing the job repeatedly or 1 time on the given time schedules like daily, monthly, weekly and etc.

=> Web-application /website is client-server app (B2C) where client is browser and server is software (website) running the automated env. called webserver IN tomcat. here the client-server will be in interaction using request-response model
eg: naresh it.com , redanz.com , flipkart.com

B2C : Business to Customer
B2B : Business to Business

The application whose services can be consumed either locally or remotely from different types of other client apps is called Distributed App... Distributed Apps are B2B applications having Application to Application interaction
eg: ICC Score Comp , BSE Comp , Weather Report Comp ,Phone Server App and etc..

ICC : International Cricket Council
BSE : Bombay Stock Exchange
